NAME

codata - Command line for codata

SYNOPSIS

```
codata [OPTIONS] [REGEX_PATTERN ... ]
```

DESCRIPTION

codata is a command line interface which prints all the **codata** constants.

The current values are from 2022. Older values can be retrieved if needed and the output can be filtered with REGEX PATTERNS.

OPTIONS

--year, -y YEAR
: Year of the **codata** constants: 2022, 2018, 2014, 2010

--pattern, -p PATTERN
: Regex pattern for filtering the constants.

--value, -a
: Show only the value.

--error, -e
: Show only the uncertainty.

--usage Show usage text and exit.

--help Show help text and exit.

--verbose
: Display additional information.

--version
: Show version information and exit.

NOTES

You may replace the default options from a file if your first options begin with @file. Initial options will then be read from the "response file" "file.rsp" in the current directory.

If "file" does not exist or cannot be read, then an error occurs and the program stops. Each line of the file is prefixed with "options" and interpreted as a separate argument. The file itself may not contain @file arguments. That is, it is not processed recursively.

For more information on response files see https://urbanjost.github.io/M_CLI2/set_args.3m_cli2.html

EXAMPLE

Minimal example

```
codata
codata -y 2018 molar electron
codata -y 2014 -p 'molar.*gas','electron.*eV'
codata '[B,b]oltzmann.*eV'
```

NAME

codata - libray for fundamental physical constants

LIBRARY

codata (**-libcodata**, **-lcodata**)

SYNOPSIS

use *codata*
include "codata.h"
import *pycodata*

DESCRIPTION

codata is a Fortran library providing the fundamental physical constants according to CODATA (https://www.nist.gov/programs-projects/*codata*-values-fundamental-physical-constants). A C API allows usage from C, or can be used as a basis for other wrappers. A python wrapper allows easy usage from Python.

The latest *codata* constants (2022) https://pml.nist.gov/cuu/Constants were integrated in stdlib https://github.com/fortran-lang/stdlib/releases/tag/ since version 0.7.0. The constants are implemented as derived type which carries the name, the value, the uncertainty and the unit. This library is complementary to the constants defined in the stdlib by providing older values for the constants. The latest values (2022) do not have the year as a suffix in their name whereas older values (2010, 2014, 2018) feature the year as a suffix in their name.

All *codata* (physical) constants are defined as a derived type codata_constant_type. All the *codata* constants are provided as double precision reals. The names are quite long and can be aliased with shorter names. The derived type codata_constant_type defines 4 members and 2 procedures.

```
type :: codata_constant_type
    character(len=64) :: name
    real(dp) :: value
    real(dp) :: uncertainty
    character(len=32) :: unit
contains
    procedure :: print
    procedure :: to_real_sp
    procedure :: to_real_dp
    generic :: to_real => to_real_sp, to_real_dp
end type codata_constant_type
```

A module level interface to_real is available for getting the constant value or uncertainty of a constant.

o to_real(self, mold, uncertainty) result(r)
Get the constant value or uncertainty. Warning: Some constants cannot be converted to single precision sp reals due to the value of the exponents.

o class(codata_constant_type), intent(in) :: self
Codata constant

o real(sp), intent(in) :: mold
Should be of type real single or double precision

o logical, intent(in), optional :: uncertainty
Set to true if the uncertainty is required. Default to .false..

The C API exposes a structure codata_constant_type that defines the same members as in Fortran. to_real is not exposed in the C API.

```
type, bind(C) :: capi_constant_type
    character(kind=c_char) :: name(65)
    real(c_double) :: value
```

```
        real(c_double) :: uncertainty
        character(kind=c_char) :: unit(33)
    end type capi_constant_type

    typedef struct codata_constant_type{
        char name[65];
        double value;
        double uncertainty;
        char unit[33];
    }cct;
```

The Python wrapper encapsulates the members in a dictionnary with the keys being name, value, uncertainty and unit. to_real is not exposed in the Python wrapper.

NOTES

To **use** *codata* within your **fpm**(1) (https://github.com/fortran-lang/fpm) project, add the following lines to your file:

```
[dependencies]
codata = { git="https://github.com/MilanSkocic/codata.git" }
```
