codata(3)                    Library Calls                    codata(3)

NAME
       codata - libray for fundamental physical constants

LIBRARY
       codata (-libcodata, -lcodata)

SYNOPSIS
       use codata
       include "codata.h"
       import pycodata

DESCRIPTION
       codata  is  a Fortran library providing the fundamental physical
       constants according  to  CODATA  (https://www.nist.gov/programs-
       projects/codata-values-fundamental-physical-constants).  A C API
       allows  usage  from C, or can be used as a basis for other wrap-
       pers.  A python wrapper allows easy usage from Python.

       The latest codata constants (2022) https://pml.nist.gov/cuu/Con-
       stants were  integrated  in  stdlib  https://github.com/fortran-
       lang/stdlib/releases/tag/  since  version  0.7.0.  The constants
       are implemented as derived type  which  carries  the  name,  the
       value, the uncertainty and the unit.  This library is complemen-
       tary  to  the constants defined in the stdlib by providing older
       values for the constants.  The latest values (2022) do not  have
       the  year  as a suffix in their name whereas older values (2010,
       2014, 2018) feature the year as a suffix in their name.

       All codata (physical) constants are defined as  a  derived  type
       codata_constant_type.   All the codata constants are provided as
       double precision reals.  The names are quite  long  and  can  be
       aliased  with  shorter  names.   The  derived  type  codata_con-
       stant_type defines 4 members and 2 procedures.
```

```
type :: codata_constant_type
    character(len=64) :: name
    real(dp) :: value
    real(dp) :: uncertainty
    character(len=32) :: unit
contains
    procedure :: print
    procedure :: to_real_sp
    procedure :: to_real_dp
    generic :: to_real => to_real_sp, to_real_dp
end type codata_constant_type
```

A module level interface to_real is available for getting the constant value or uncertainty of a constant.

- o to_real(self, mold, uncertainty) result(r)
  Get the constant value or uncertainty. Warning: Some constants cannot be converted to single precision sp reals due to the value of the exponents.

  - o class(codata_constant_type), intent(in) :: self
    Codata constant

  - o real(sp), intent(in) :: mold
    Should be of type real single or double precision

  - o logical, intent(in), optional :: uncertainty
    Set to true if the uncertainty is required. Default to .false..

The C API exposes a structure codata_constant_type that defines the same members as in Fortran. to_real is not exposed in the C API.

```
type, bind(C) :: capi_constant_type
    character(kind=c_char) :: name(65)
    real(c_double) :: value
    real(c_double) :: uncertainty
    character(kind=c_char) :: unit(33)
end type capi_constant_type

typedef struct codata_constant_type{
    char name[65];
    double value;
    double uncertainty;
    char unit[33];
}cct;
```

The Python wrapper encapsulates the members in a dictionary with the keys being name, value, uncertainty and unit. to_real is not exposed in the Python wrapper.

codata(1)                    User Commands                     codata(1)

NAME
       codata - Command line for codata

SYNOPSIS
       codata [OPTIONS] [REGEX_PATTERN ... ]

DESCRIPTION
       codata  is  a command line interface which prints all the codata
       constants.

       The current values are from 2022.  Older values can be retrieved
       if needed and the output can be filtered with REGEX PATTERNS.

OPTIONS
       --year, -y YEAR
              Year of the codata constants: 2022, 2018, 2014, 2010

       --pattern, -p PATTERN
```

Regex pattern for filtering the constants.

--value, -a
Show only the value.

--error, -e
Show only the uncertainty.

--usage
Show usage text and exit.

--help Show help text and exit.

--verbose
Display additional information.

--version
Show version information and exit.

NOTES

You may replace the default options from a file if your first options begin with @file. Initial options will then be read from the "response file" "file.rsp" in the current directory.

If "file" does not exist or cannot be read, then an error occurs and the program stops. Each line of the file is prefixed with "options" and interpreted as a separate argument. The file itself may not contain @file arguments. That is, it is not processed recursively.

For more information on response files see https://urban-jost.github.io/M_CLI2/set_args.3m_cli2.html

EXAMPLE

Minimal example

```
codata
codata -y 2018 molar electron
codata -y 2014 -p 'molar.*gas','electron.*eV'
codata '[B,b]oltzmann.*eV'
```
