**NAME**

**codata** - fundamental physical constants

**LIBRARY**

Codata (-libcodata, -lcodata)

**SYNOPSIS**

```
use codata
include "codata.h"
import pycodata
```

**DESCRIPTION**

*codata* is a Fortran library providing the fundamental physical constants according to CODATA <https://www.nist.gov/programs-projects/codata-values-fundamental-physical-constants>. A C API allows usage from C, or can be used as a basis for other wrappers. Python wrapper allows easy usage from Python.

The latest *codata* constants 2022 <https://pml.nist.gov/cuu/Constants> were integrated in stdlib <https://github.com/fortran-lang/stdlib/releases/tag/v0.7.0>. The constants are implemented as derived type which carries the name, the value, the uncertainty and the unit. This library is complementary to the constants defined in the stdlib by providing older values for the constants.

The latest values (2022) do not have the year as a suffix in their name. Older values can be used and they feature the year as a suffix in their name.

All *codata* (physical) constants are defined as a derived type codata\_constant\_type. All the *codata* constants are provided as double precision reals. The names are quite long and can be aliased with shorter names.

The derived type codata\_constant\_type defines 4 members:

- o name** string
- o value** double precision real
- o uncertainty**  
double precision real
- o unit** string

The derived type codata\_constant\_type defines 2 type-bound procedures:

- o print** to print the values of the constant members;
- o to\_real**  
to get the value or the uncertainty to the desired precision.

A module level interface to\_real is available for getting the constant value or uncertainty of a constant.

The C API exposes a structure codata\_constant\_ttype that defines the same members as in Fortran. The Python wrapper encapsulates the members in a dictionary.

**NOTES**

To **use** *codata* within your fpm <https://github.com/fortran-lang/fpm> project, add the following lines to your file:

```
[dependencies]
codata = { git="https://github.com/MilanSkocic/codata.git" }
```

**EXAMPLE**

**NAME**

**get\_version** - version getter for the library

**LIBRARY**

Codata - (-libcodata, -lcodata)

**SYNOPSIS**

```
function get_version() result (fptr)
```

**DESCRIPTION**

This function returns the version of the codata library.

**RETURN VALUE**

**character(len=:), pointer ::** *fptr*

**NOTES**

The C API is defined by the following prototype: `char* codata_get_version(void)`

The python wrappers embeds the version of the version in the top level variable `__version__`.

**EXAMPLE**

Fortran

```
print *, "version = ", get_version()
```

C

```
printf("version = %s0, codata_get_version());
```

Python

```
print(f"version = {pycodata.__version__}")
```
