NAME

codata - Command line for codata

SYNOPSIS

codata [*OPTIONS*] [*REGEX_PATTERN* ...]

DESCRIPTION

codata is a command line interface which prints all the **codata** constants.

The current values are from 2022. Older values can be retrieved if needed and the output can be filtered with REGEX PATTERNS.

OPTIONS

--year, -y YEAR

Year of the **codata** constants: 2022, 2018, 2014, 2010

--pattern, -p PATTERN

Regex pattern for filtering the constants.

--value, -a

Show only the value.

--error, -e

Show only the uncertainty.

--usage Show usage text and exit.

--help Show help text and exit.

--verbose

Display additional information.

--version

Show version information and exit.

NOTES

You may replace the default options from a file if your first options begin with @file. Initial options will then be read from the "response file" "file.rsp" in the current directory.

If "file" does not exist or cannot be read, then an error occurs and the program stops. Each line of the file is prefixed with "options" and interpreted as a separate argument. The file itself may not contain @file arguments. That is, it is not processed recursively.

For more information on response files see https://urbanjost.github.io/M_CLI2/set_args.3m_cli2.html

EXAMPLE

Minimal example

```
codata
codata -y 2018 molar electron
codata -y 2014 -p 'molar.*gas','electron.*eV'
codata '[B,b]oltzmann.*eV'
```

NAME

codata - library for fundamental physical constants

LIBRARY

codata (-libcodata, -lcodata)

SYNOPSIS

```
use codata
include "codata.h"
import pycodata
```

DESCRIPTION

codata is a Fortran library providing the fundamental physical constants according to CODATA (<https://www.nist.gov/programs-projects/codata-values-fundamental-physical-constants>). A C API allows usage from C, or can be used as a basis for other wrappers. A python wrapper allows easy usage from Python.

The latest *codata* constants (2022) <https://pml.nist.gov/cuu/Constants> were integrated in stdlib <https://github.com/fortran-lang/stdlib/releases/tag/> since version 0.7.0. The constants are implemented as derived type which carries the name, the value, the uncertainty and the unit. This library is complementary to the constants defined in the stdlib by providing older values for the constants. The latest values (2022) do not have the year as a suffix in their name whereas older values (2010, 2014, 2018) feature the year as a suffix in their name.

All *codata* (physical) constants are defined as a derived type `codata_constant_type`. All the *codata* constants are provided as double precision reals. The names are quite long and can be aliased with shorter names. The derived type `codata_constant_type` defines 4 members and 2 procedures.

```
type :: codata_constant_type
  character(len=64) :: name
  real(dp) :: value
  real(dp) :: uncertainty
  character(len=32) :: unit
contains
  procedure :: print
  procedure :: to_real_sp
  procedure :: to_real_dp
  generic :: to_real => to_real_sp, to_real_dp
end type codata_constant_type
```

A module level interface `to_real` is available for getting the constant value or uncertainty of a constant.

o `to_real(self, mold, uncertainty) result(r)`

Get the constant value or uncertainty. Warning: Some constants cannot be converted to single precision sp reals due to the value of the exponents.

o `class(codata_constant_type), intent(in) :: self`

Codata constant

o `real(sp), intent(in) :: mold`

Should be of type real single or double precision

o `logical, intent(in), optional :: uncertainty`

Set to true if the uncertainty is required. Default to .false..

The C API exposes a structure `codata_constant_type` that defines the same members as in Fortran. `to_real` is not exposed in the C API.

```
type, bind(C) :: capi_constant_type
  character(kind=c_char) :: name(65)
  real(c_double) :: value
```

```

        real(c_double) :: uncertainty
        character(kind=c_char) :: unit(33)
end type capi_constant_type

typedef struct codata_constant_type{
    char name[65];
    double value;
    double uncertainty;
    char unit[33];
}cct;

```

The Python wrapper encapsulates the members in a dictionary with the keys being name, value, uncertainty and unit. `to_real` is not exposed in the Python wrapper.

NOTES

To use *codata* within your **fpm**(1) (<https://github.com/fortran-lang/fpm>) project, add the following lines to your file:

```

[dependencies]
codata = { git="https://github.com/MilanSkocic/codata.git" }

```
